

Alpha + Bliss detailed progress and state report

Posture: local proofs only. Delivery NOT_SENT. Green does not send. Hosted acceptance is not claimed. No census, traffic, price, or revenue was invented.

As of: 2026-10-03

Repository baseline: `ed8b8f1` (main, after pull request #97)

Scope: Alpha acquisition Phases 4–29, priority contracts 1–16, Bliss Chapel, Economics, Wedding Planner, live local readings, verification, limitations, and recommended next work.

This report describes stored evidence only. It invents no census, traffic, price, revenue, cost, or hosted deployment claim. Delivery remains `NOT_SENT`. Green does not send.

1. Executive summary

Alpha and Bliss run as one ASP.NET Core application with one PostgreSQL system of record and one operations console. The acquisition tracker records Phases 4–29 as verified local proofs. Since the previous current-state report (baseline `60e0913`, 347 tests), fifteen priority contracts have been built, tested, recorded in a browser, and documented. Priority 3, the formal next-contract planning review, has no row in the tracker.

Measure	Previous report	This report
Full test suite	347 passed	441 passed, 0 failed, 0 skipped
Acquisition phases verified	4–29	4–29 (unchanged)
Priority contracts closed	none	1, 2, 4–16
Evidence PDFs in the repository	26 acquisition PDFs	42 PDFs, plus this report
EF Core migrations	—	30
Operations console views	—	26
Merged pull requests	—	97

The main strength is still the integrity of the boundaries. A public contact is not permission to send. A missing person, price, count, market, or model stays missing. Suppression stops the prohibited action and keeps the business. Every new reading in this cycle refuses an invented value with an HTTP 400 and states that nothing was sent.

The platform is not finished. Hosted acceptance is not claimed, live sending has no authorized contract, revenue is not recorded, and the seven grooming models are not configured.

2. Architecture

2.1 Application boundary

Project	Responsibility
<code>Bliss.Api</code>	REST API, public Alpha and Bliss pages, the operations console, rate limiting, write authorization
<code>Bliss.Domain</code>	Pure deterministic deciders. Illegal states throw <code>InvalidOperationException</code>

Project	Responsibility
Bliss.Infrastructure	EF Core 8 and Npgsql mappings, migrations, seed data, persistence
Bliss.Tests	xUnit tests for architecture, persistence, authorization, API, frontend contracts, and each demonstration

2.2 Authority boundary

Decision	Authority
Creator and advertiser compatibility	DeterministicRuleEvaluator
Price, quote, negotiation envelope	Economics (the only price authority)
Campaign workspace	Wedding Planner
Durable business state	PostgreSQL database bliss_chapel
Routine compositing and QR	Deterministic software; recipe overlay-1
Human authority	Creative approval, binding negotiation, authorization, close

2.3 The pattern every priority contract follows

1. A static decider in Bliss.Domain/Demonstrations validates the input and refuses invented values, blank keys, and missing history.
2. An idempotent key (8-80 characters, letters, digits, hyphens) makes a repeated submission return the stored record with duplicate: true and written: false. It does not overwrite or raise counts.
3. A controller turns a refusal into HTTP 400 with delivery: "NOT_SENT", greenMeansSend: false, and the safety flags for that reading.
4. An EF Core migration adds one append-only table.
5. One view on the existing operations console shows the reading and a refused action. No second console is created.
6. Evidence is a markdown record, a contract, a browser recording reviewed frame by frame, screenshots, and a letter-size PDF checked with pypdf.

3. Alpha acquisition Phases 4-29

All twenty-six phases are verified local proofs. Accepted Bliss, Economics, and Wedding Planner work stays on its own acceptance path.

Phases	Capability
4-5	Source media library, duplicates, fuel; one software demonstration with QR, disclosure, and an unsent preview
6-9	Discovery at score 100; public decision-maker evidence; preserving a business below 100; contact roads and suppression
10-12	Recipe runtime and overlay; factory QA and batch manifest; acquisition events from observable behavior
13-16	Ask Alpha (one voice, answer then advance); price answers from Economics; negotiation inside Economics; eligible delivery that stays NOT_SENT
17-20	Prospect memory in PostgreSQL; Bliss rematch; Wedding Planner wake; conversation laboratory (10 scenarios)
21-25	Spend and pause controls; grooming and external research; scale proofs at 100, 1,000, and 10,000 in-memory checks; green/yellow/red progression; flow control
26-29	Independent fleet lanes; marketplace balance signals; balanced creative inventory (pairs of 2, 4, or 6); rotation abundance

4. Priority contracts completed in this cycle

Priority	Capability	What the proof stores	What it refuses
1	Bliss hosted acceptance reading	The process posture: Development, gates not applied, no hosted database, no verified server certificate, no HTTPS identity provider, no backup declared	Claiming hosted acceptance; claiming an identity provider was contacted or a backup drill was run
2	Economics Phase 9 owner acceptance	Accepted by the owner on 2026-10-03. Actuals stay append-only. Zero placements and zero campaigns are on file	Repricing, settlement, rewriting a recommendation
4	Subscription ledger and factory budget	Stored service rows; operational ceilings that degrade only their own scope	Inventing a cost; treating a review as a purchase
5	Deterministic media runtime	The player is the served picture. QA matches the QR and the disclosure	Requiring a permanent per-prospect composite
6	Source media coverage	Coverage counts qualified slices with a fingerprint and provenance	Counting a duplicate as coverage
7	Bounded advertiser discovery	One stored prospect per public source URL	A duplicate source, a blank name, a crawler, a census
8	Contact route audit	One explicit transmission request recorded once	Routing through suppression, stale evidence, or a missing source; transmitting
9	Local batch measurement	The clock and the process working set	Claiming an invoice, hosted acceptance, or the 15-minute target

Priority	Capability	What the proof stores	What it refuses
10	Marketplace handoff	A qualified advertiser and a stored creator handed to <code>DeterministicRuleEvaluator</code> once	A preserved advertiser; another tenant's row; declaring a win
11	Human creative approval	A human decision inside an open workspace	Opening a discovered business; marking campaign ready; inventing a price
12	Research ledger	A note appended only after the laboratory graduates	Changing production; showing another prospect's note
13	Later rotation period	Measured open slots and the creator decision	Filling a theoretical slot; rewriting stored slots
14	Coverage week	One week of measured coverage	Adding a missing market; claiming a census
15	Marketplace metrics	Measured advertiser, creator, and slot counts; zero revenue rows	Recording a revenue amount; adding a slot
16	Closed models	Seven grooming models are not configured; configured models stay at zero	Configuring a model; claiming authorized traffic or an engagement count

5. Live local readings

Read from the running API at `http://127.0.0.1:5001` on 2026-10-03 against local PostgreSQL. These are counts of stored rows, not a census.

5.1 Hosted posture (`/api/operations/hosted`)

Field	Value
Environment	Development
Production gates applied	false
Hosted database configured	false
Database server certificate verified	false
Identity provider over HTTPS	false
Backup declared	false
Secret material external	true
Role claims distinct	true
Hosted acceptance claimed	false

5.2 Economics Phase 9 (`/api/operations/acceptance`)

Accepted: true. Placements on file: 0. Campaigns on file: 0. "No historical actual is on file. None was invented." Repricing and settlement are not authorized.

5.3 Fuel and coverage (`/api/operations/fuel` , `/api/operations/week`)

Field	Value
Daily target	20
Submitted	2
Qualified unique	1
Duplicates	1
Daily remaining	19
Fuel status	SHORTAGE
Markets with coverage	1 (Panama City, Panama: 1 qualified slice)
Stored week	coverage-week-1

5.4 Discovery (`/api/operations/discovery`)

Three stored prospects with a public source URL. Two scored, one preserved. One submission was withheld because it had no public http or https source.

Business	Market	Score	State
Casa Verde	Panama City	100	DEMONSTRATION_PREPARED
Mesa Norte	Panama City	100	DEMONSTRATION_PREPARED
Puerto Azul	Quito	75	PRESERVED

5.5 Marketplace (`/api/operations/metrics` , `/api/operations/rotation`)

Field	Value
Stored advertisers	4 (Harbor Audio Labs, Sunrise Wellness Co., TEST Dental Manila, TEST Restaurant Santo Domingo)
Stored creators	3 (Test Creator, Test Creator Brazil, Unknown Demographics Creator)
Stored slots	8
Revenue rows	0
Pressure	Stored advertiser pressure is ahead of stored creator pressure
Later periods	later-period-1 (creator approved), later-period-withheld (creator not approved); 6 theoretical slots, 4 placed, 2 open

5.6 Learning and models (/api/operations/learning , /api/operations/models)

Field	Value
Laboratory	Passed 10 of 10 scenarios
Research notes	1 (Casa Verde)
Configured grooming models	0 of 7
Model calls	0
Authorized traffic	false
Production changed	false

5.7 Subscription ledger (/api/operations/ledger)

Bliss Bot Chapel is classified `FREE_SELF_HOSTED`. PostgreSQL and the OpenID Connect identity service are observed, with owner, plan, and cost unrecorded. "Cost is not recorded. None was invented."

6. Bliss Chapel, Economics, and Wedding Planner

Bliss Chapel. Phases 1–20 cover deterministic matching, eligibility, review, placement planning, operator workflows, audit exports, verification receipts, OIDC, runtime hardening, observability, and fail-closed production posture. The hosted reading in Priority 1 shows those gates are not yet applied to a real hosted environment. Hosted deployment is not declared finished.

Economics. Phases 1–9 are implemented. The owner accepted Phase 9 on 2026-10-03. Economics is the only price authority. Operational ceilings, stored counts, pair sizes, and rotation slots are not prices. Historical actuals do not change recommendations or quotes and create no settlement, invoice, payment, or payout.

Wedding Planner. Phase 1 provides workspaces, sessions, messages, audit, authorization, and tenancy, with zero AI. Alpha Phase 19 lets an accepted Economics result open an existing workspace. Priority 11 records a human creative decision inside an open workspace. Phases 2–9 are not started.

7. Verification

```
dotnet test Bliss.Tests/Bliss.Tests.csproj --verbosity minimal
Passed! - Failed: 0, Passed: 441, Skipped: 0, Total: 441
```

Each priority contract in this cycle was also checked by:

- a scan of the new domain code for currency signs and provider clients (\$, OpenAI , Smt , HttpClient), with none found;
- applying its migration to local PostgreSQL and reading the API;
- a browser screen recording reviewed frame by frame;
- a letter-size PDF checked with pypdf for page count and exact text.

How to read these results:

- passing tests prove the bounded local behavior they name;
- local PostgreSQL does not prove hosted capacity;
- in-memory scale checks do not prove stored prospect volume;
- a prepared preview does not authorize delivery;
- fixture people, businesses, and prices are not claims about real ones.

8. Known limitations and open gaps

1. Hosted acceptance is not claimed. No hosted database, server certificate, HTTPS identity provider, or backup drill is on file.
2. Live sending has no authorized Engineering Contract. Delivery stays NOT_SENT .
3. Source media is short: 1 qualified slice against a daily target of 20. Only one market has coverage.
4. Discovery holds three stored prospects. Crawlers and enrichment purchases are out of scope.
5. Revenue and inventory are not recorded. Economics holds zero actuals.
6. The seven grooming models are not configured, and no authorized traffic exists to learn from.
7. Subscription owners, plans, costs, and renewal dates are unrecorded until an operator supplies billing evidence.
8. Wedding Planner Phases 2-9 are not started.
9. Ask Alpha is not yet a queued multi-tenant conversation service.
10. Scale is measured in memory and in one local batch, not on a hosted system.

9. Recommended next work

Every remaining gap needs a real-world input that the code cannot invent.

Order	Next step	Input it needs
1	Run hosted acceptance for real	A hosted PostgreSQL endpoint with <code>VerifyFull</code> , an organizational OIDC issuer, a platform secret store, and an approved backup and restore drill
2	Fill the source-media fuel gap	Licensed source clips with provenance for each target market
3	Record subscription costs	Billing evidence from the operator
4	Contract the first authorized send	An Engineering Contract naming the channel, consent, opt-out, and audit, with explicit owner authorization
5	Grow discovery within bounds	Public sources reviewed for terms of use; any paid source passes the budget controls first
6	Advance Wedding Planner Phase 2	Its own contract, cost ceiling, and isolation tests
7	Configure learning and models	Authorized traffic and production events that justify a model

10. Conclusion

The local proof chain now runs from source media to prospects, evidence, conversation, Economics, memory, rematch, planner wake, operations, flow, fleets, inventory, rotation, coverage, marketplace metrics, and closed models. Each step stores what was measured and refuses what was not. The remaining work needs real hosted infrastructure, real media, real billing evidence, and explicit authorization before anything is sent.

This report does not authorize live sending, crawlers, enrichment purchases, new subscriptions, new AI workers, or another phase.
