

Advertiser discovery evidence report

A bounded operator screen that scores a public-source prospect before Alpha prepares one private, unsent demonstration.

2 October 2026 · Bliss Bot Chapel · Pull request 55

github.com/Coxskull/Bliss_Bot_Chapel/pull/55

213 automated tests passed

EXECUTIVE RESULT

Casa Verde, a restaurant fixture in Panama City, passes the deterministic screen at 100 only after an absolute public-source URL is recorded. Alpha then composites one Table Concept onto a qualified source slice. The named decision-maker remains UNVERIFIED , the contact tier remains TIER_4 , and delivery remains NOT_SENT .

100 Opportunity score	1 Concept prepared
UNVERIFIED Decision-maker	NOT_SENT Delivery

1. Contract boundary and operating flow

This increment follows the architecture sequence: discover and score a business before researching or personalizing to a decision-maker. It is an operator-assisted screen, not an autonomous crawler.

DETERMINISTIC SCORE

Factor	Points	Casa Verde
Configured niche	25	restaurant
Initial market	25	Panama City, Panama
Business name at least three characters	25	Casa Verde
Absolute http(s) public-source URL	25	https://example.com/casa-verde
Total	100	Pass

The fixture URL proves validation and persistence behavior. This pass records the operator-provided source; it does not independently authenticate the page or crawl it.

SAFEGUARDS PRESERVED

- A failed score is not persisted.
- No person, title, contact, price, or commercial relationship is invented.
- Likely buying roles are catalog data, not claims about a named person.
- Only one concept is prepared for a cold prospect; the four-card ABC Pharmacy artifact remains the reference exception.
- FFmpeg performs compositing and QR generation remains deterministic software.
- No mailbox, WhatsApp account, or other external channel is contacted.
- No new subscription or paid enrichment provider is introduced.

2. Discovery screen

The source-media workspace now includes a separate advertiser-discovery section. The catalog supplies niches and the six initial markets. The prospect row carries the score, state, and decision-maker status before production begins.

Figure 1. Casa Verde is recorded as a restaurant in Panama City with score 100. Its state is `DEMONSTRATION_PREPARED` after the single concept is produced. The decision-maker remains `UNVERIFIED`.

VALIDATION OBSERVED

During the browser walkthrough, native required-field validation blocked an empty business name and source. The API separately rejected a missing source with HTTP 400 and the message: “A public http or https source URL is required before a demonstration is allowed.”

3. Unsent private-message preview

After one concept is prepared, the operator can preview the proposed private message. The preview names the business and market but does not claim a live campaign or a verified person.

Figure 2. Subject: “See how Casa Verde could reach more customers in Panama City.” The page is marked **NOT SENT · PREVIEW ONLY**. Fine print says delivery is **NOT_SENT** and Casa Verde has not sponsored or endorsed the concepts.

DELIVERY BOUNDARY

This is a preview, not a send adapter.

External delivery still requires contact evidence, outreach eligibility, suppression policy, and an approved communication adapter. Pull request 55 implements none of those later contracts.

4. One-concept prospect page

The prospect page exposes the evidence state rather than hiding it. It shows the opportunity score and recorded public source alongside the existing confidence and delivery controls.

Figure 3. Casa Verde’s private page shows UNVERIFIED , TIER_4 , NOT_SENT , opportunity score 100, and the recorded source. Exactly one Table Concept appears with a 15-second video and QR code.

Field	Recorded result
Likely buying roles	Owner, General manager, Marketing manager, Brand manager
Concept	Table Concept · La Mesa · Te Espera · RESERVA HOY
Contact route	No verified named person and no verified company mailbox

5. Conversation and disclosure

The deterministic conversation path preserves the evidence boundary. It does not turn a likely role into a named person and it does not invent a price.

Figure 4. The page records both questions, the two guarded replies, the QR, and the disclosure that Casa Verde did not sponsor, commission, approve, or endorse the concepts.

Decision-maker reply: “A named decision-maker is not verified, so I will not address anyone by a personal name.”

Pricing reply: “I can discuss the shape of a podcast placement, and I cannot invent a price. Custom pricing and a binding quote stay with a human.”

6. Verification and limits

AUTOMATED VERIFICATION

```
dotnet test Bliss.Tests/Bliss.Tests.csproj --verbosity minimal
```

213

Passed

0

Failed or skipped

The added proofs are `OpportunityScreenTests` and `ProspectDiscoveryApiTests`. They cover the 100-point screen, missing-name and missing-source rejection, language-sensitive overlay copy, disclosure, catalog output, the no-clip production guard, one-concept production, `NOT_SENT`, `UNVERIFIED`, and the decision-maker response.

MANUAL VERIFICATION

- Desktop flow: required fields → score 100 → one concept → unsent preview → private page → guarded conversation.
- Phone-width check: discovery form, facts, concept, video, QR, chat, and disclosure remained readable without overlap.
- Screen recording: `advertiser_discovery_score_then_one_unsent_demonstration.mp4`.

KNOWN LIMITS

- The operator supplies the business and source; there is no crawler or autonomous web research.
- The screen validates URL shape, not the truth, ownership, or current content of the page.
- Decision-maker research and contact verification remain a later bounded contract.
- No live delivery, enrichment purchase, or paid subscription is included.
- The demonstration library remains file-backed for this proof. PostgreSQL remains the long-term system of record.
