

HARBORLIGHT ACCEPTANCE PHASES

Date: 2026-10-07

Status: HV-0 is the decision in this document. HV-1 through HV-5 do not start until the owner approves the provider and the cost ceiling.

Parent amendments: Creative Academy and Advertising Real Estate both stay OPEN.

These phases continue from the implementation that is already built. They do not rebuild registration, LEARN and DO NOT COPY notes, provenance, selective retrieval, geometry, recomposition, the REGENERATE check, the seven Ask Alpha scenarios, or the conversation ledger. Missing prices, delivery, quality grades, and production evidence stay missing until a real source exists.

Infrastructure readiness is not production acceptance. One controlled Harborlight voyage is the next production milestone.

PROVIDER DECISION, BEFORE ANY SPEND

No purchase is made by this document. No new subscription is requested.

1. Provider. The OpenAI Images API through the adapter already installed in CreativeImageGenerator. Alpha keeps the Academy, quality intelligence, workflow, and business records. The provider is a replaceable worker.
2. Model. The installed default is gpt-image-1. The installed size mapper selects 1536x1024 for a landscape request. The current request does not set a quality tier, so the provider default would apply. For this one acceptance image, HV-1 should set quality high on that existing request after approval, because the acceptance question is premium visual class.
3. Why it is required. Retrieval, geometry, and recomposition are already software. They cannot create a new photoreal commercial advertisement. FFmpeg and the deterministic QR and compositing path are for routine assembly, not for an original Academy-class creative.
4. Existing Alpha capability. The OpenAI image adapter, secret-store token path, draft ledger, originality check, and voyage orchestrator already exist. A consumer ChatGPT subscription is rejected by the subscription ledger and cannot be the production worker.
5. Estimated cost for one generation. OpenAI's published gpt-image-1 output price at 1536x1024, checked 2026-10-07, is 0.016 dollars low, 0.063 dollars medium, and 0.25 dollars high. Prompt text tokens are additional and small beside a high-quality image. Reference images will not be sent, so image-input charges do not apply. One high-quality image is about 0.25 dollars plus prompt tokens. One failed attempt plus one retry is about 0.50 dollars plus prompt tokens.
6. New subscription. No.
7. Usage-based credits. Yes. API credits on the Alpha-controlled OpenAI account are sufficient. Add

credits to that account. Do not open a second image product.

gpt-image-1 is scheduled for deprecation on 2026-10-23. If approval comes after that date, HV-1 uses the successor model on the same OpenAI API account. That change is a model setting, not a new subscription.

The proposed ceiling for this voyage is 2.00 dollars. The run stops and asks before a third paid generation. The provider invoice is the cost of record. This estimate is not a recorded cost.

STANDING RULES

Do not mark either parent amendment complete.

Do not invent an Economics price, a duration price, a discount, a quality grade, a regression pass, a delivery count, or a hosted acceptance.

Do not send Academy reference image files to the provider.

Do not manually pick references to force a success, and do not coach the image into a prototype's identity, person, product, wording, background, or composition.

Do not put credentials in source control, reports, or screenshots.

A failed generation is kept. One controlled retry is allowed inside the cost ceiling.

Delivery remains NOT_SENT. A later simulated delivery, if separately authorized, must be labeled TEST/SIMULATED and must not be described as a real campaign.

Economics remains NO_AUTHORIZED_PRICE until authorized commercial values are supplied on a separate track.

HV-0 DECISION

Record the provider, model, existing-capability check, estimate, and ceiling before any credential is configured or any image is purchased.

Done when the owner approves OpenAI usage credits, gpt-image-1 or its same-account successor, quality high, and the 2.00 dollar ceiling. No key is stored in the repository.

This document is HV-0. It does not approve itself.

HV-1 CONFIGURE THE EXISTING ADAPTER

Point the installed generator at the approved account after HV-0 approval.

Reuse Runtime:CreativeGeneration:Provider=OpenAI, Model, and ApiToken or ApiToken_FILE from the platform secret store. Rotate the temporary key that was pasted in chat. The new key is not written into git, reports, or screenshots.

The allowed change is to set quality high on the existing OpenAI request body, and to record provider, model, job identifier, attempt count, and the invoice amount the provider returns. Do not add a second generator.

Done when configuration is present only in the secret store, a redacted reading says the provider is configured, and no live Harborlight image has been requested yet.

HV-2 ONE HARBORLIGHT VOYAGE

Let the existing voyage produce one new Harborlight Pharmacy advertisement for Panama City.

Flow: brief, automatic Academy retrieval, retrieval reasons, LEARN and DO NOT COPY notes, GQD-1, new creative DNA, art direction, original generation, inventory recomposition, originality check. Visual QA and human review are HV-4. They are not invented during generation.

Reuse the acceptance-voyage orchestrator, selective retrieval, stored geometry, and recomposition. The creative is recomposed into the stored ARE-P01 slots. It is not a scaled prototype.

Done when one voyage record contains the finished image or a recorded provider failure, the job identifier, the attempt count, and the actual cost. Campaign ready stays false. Delivery stays NOT_SENT. Model calls are the real calls, not a guessed count.

HV-3 EVIDENCE PACKAGE

Publish the voyage without hiding a failed attempt.

The package contains the Harborlight brief, automatically retrieved references, retrieval reasons, LEARN and DO NOT COPY notes, the Quality DNA version used, the new creative DNA, provider, model, job identifier, generation attempts, the finished original, the inventory-adapted creative, the originality result, visual QA, deterministic QA where it applies, failures and retries, the human-review result, actual usage, actual cost, and the workflow trace.

Done when every item above is either stored evidence or an explicit NOT_RUN or UNRECORDED fact. No item is filled with a placeholder image or an invented number.

HV-4 HUMAN VISUAL REVIEW AND QUALITY DNA

A person judges whether the finished creative reaches the Academy visual class: commercial color, saturation, contrast, highlights, shadows, lighting, materials, people when applicable, depth, separation, typography, hierarchy, polish, screen impact, and Premium Dominant Presence. The same review checks that the creative did not copy a prototype's company, identity, person, product, photograph, wording, background, composition, or distinctive identity.

GQD-1 stays the attribute list. Grades stay UNCLASSIFIED until a human classifies a specific attribute from evidence. The phase prepares the attribute list for that review. It does not write scores to complete the field.

Done when the human review result is recorded by the owner. Unreviewed attributes remain UNCLASSIFIED.

HV-5 REGRESSION BASELINE

After, and only after, the owner accepts the finished creative, store that accepted image as the Creative Quality Regression baseline.

Done when the suite can name the accepted baseline asset. It is not marked passed merely because an API returned HTTP 200. Until an accepted creative exists, the suite stays BASELINE_NOT_RECORDED.

SEPARATE TRACKS THESE PHASES DO NOT CLOSE

Creative Academy amendment: OPEN. Production acceptance remains.

Advertising Real Estate amendment: OPEN. Economics and remaining commercial acceptance remain.
Economics: NO_AUTHORIZED_PRICE for ARE-P01, ARE-P02, ARE-S01, ARE-E01, duration, and 5-versus-20 occurrences.

Delivery: NOT_SENT. No impressions, displays, scans, clicks, or engagement are invented.

Hosted acceptance: UNCLAIMED.

Regression: BASELINE_NOT_RECORDED until HV-5.

ACCEPTANCE QUESTION

Can Alpha autonomously create a new advertisement that reaches the visual quality class of the 50 Creative Academy prototypes, without copying one of them?

HV-2 produces the attempt. HV-4 is the human answer. Neither phase is allowed to invent that answer.
